LIKHITA BURADA

Data Analyst | Product Analytics | Experimentation | Applied AI

Seattle, WA | likhitab66@gmail.com | linkedin.com/in/buradalikhita | github.com/Likhitab66 | likhitab66.github.io

SUMMARY

Analyst by trade, builder by habit. Data analyst on Prime Video Sports at Amazon; before that, analytics for Fortune 500 clients at Mu Sigma. Finds where viewers drop off in clickstream data, runs A/B tests end to end, and builds her own tools: an incident agent with guardrails, RAG with grounding checks and a stockout-risk model.

SKILLS

Languages and libraries: SQL, Python (pandas, scikit-learn, networkx, Plotly, pytest), R, SAS and SAS macros, VBA, MATLAB

BI and reporting: Tableau, Power BI (star schemas, DAX), Excel, R Shiny, automated reporting, KPI dashboards

Product analytics and experimentation: A/B testing, experiment design, significance testing, clickstream, funnel and engagement analysis, KPI definition, anomaly detection, root-cause analysis

Machine learning and statistics: logistic regression, random forest, gradient boosting, clustering, survival analysis, time-series forecasting, hypothesis testing, TensorFlow, PyTorch

Generative AI: RAG, LLM evaluation, agentic tool use, guardrails, hallucination detection, ChromaDB, LangChain

Data engineering: DuckDB, semantic layers, feature engineering, data validation, pipeline automation

Domains: streaming media and live sports, healthcare (FHIR), retail forecasting and inventory planning, sales analytics

EXPERIENCE

Data Analyst, Prime Video Sports (Live Events) Apr 2024 to Present

Amazon, Seattle, WA

- Find navigation friction and drop-off in large-scale clickstream data with SQL and Python across device platforms (iOS, Android, web, Fire TV, Apple TV, Roku, Samsung, LG), and turn the findings into UX fixes for live-event flows.
- Run A/B experiments end to end: set hypotheses and success metrics, test engagement and funnel results for statistical significance, and give product and engineering a clear ship or no-ship recommendation.
- Join behavioral metrics with defect data in SQL and segment by device and platform to size experience gaps, then walk playback, navigation and feature teams through what to fix first.
- Monitor latency, availability and error-rate KPIs in Tableau for Thursday Night Football.
- Analyze traffic and performance around record peak events, including the Jan 2026 Wild Card game, to flag risk early and inform capacity and quality decisions with playback and platform teams.
- Supported quality analytics for the first season of NBA coverage on Prime Video and integration quality for the Fox One add-on launch (Aug 2025).

Platform context, public figures and not my results: Thursday Night Football on Prime averaged 15.33M viewers per game in 2025 (Nielsen), and the Jan 2026 Wild Card game drew 31.61M viewers including local simulcasts, the most-watched NFL game on a streaming service.

Trainee Decision Scientist Jul 2021 to Dec 2022

Mu Sigma, Bangalore, India

- Turned ambiguous business problems from Fortune 500 clients into structured analyses: gathered requirements, defined success metrics and presented recommendations in weekly business reviews.
- Automated recurring reports and exploratory analyses on large client datasets with SQL and Python, replacing work that had been done by hand.
- Built Tableau and Excel dashboards that client teams used to track sales and operations KPIs and act on emerging trends.
- Applied hypothesis testing, regression and clustering to customer and sales data to find demand drivers and customer segments, informing pricing and marketing decisions.
- Built time-series forecasts of product demand in Python to support client inventory and planning decisions.

PROJECTS

StreamSleuth: Agentic Root-Cause Analysis for Live-Stream Incidents

Python, DuckDB, pandas, pytest (54 tests) | synthetic data github.com/Likhitab66/streamsleuth-agentic-rca

- Built an agent that investigates live-stream incidents: event-aware KPI anomaly detection, a bounded planning loop over 8 typed tools, four guardrails (ticket input, tool calls, tool responses, every number in the memo) and a read-only DuckDB semantic layer as its only data path.
- Scored it on a 33-scenario eval battery using its rule-based (deterministic) planner: precision@1 and recall@1 of 1.00 and memo grounding of 1.00 on 25 core faults, 0 false alarms on 5 clean days, and recall@1 of 0.50 on 2 held-out scenarios outside every tuned range (1 of 2 detected).
- Added an A/B readout that runs a chi-square sample-ratio-mismatch check first, refuses to estimate an effect when it fails, and reports an 80%-power minimum detectable effect.

Sales and Inventory Analytics | Master's Capstone, Rebuilt on Synthetic Data

Python, scikit-learn, Power BI, pytest (15 tests) | synthetic data github.com/Likhitab66/retail-sales-inventory-analytics

- Rebuilt the MS capstone as a reproducible pipeline on synthetic data (200 SKUs over 104 weeks) and measured availability with a velocity-weighted in-stock metric (WISP), so a stocked-out best seller counts for more than a slow mover: 92.2% WISP against 91.1% plain in-stock.
- Trained a random forest that flags stockout risk four weeks ahead (precision 0.693, recall 0.869 on a time-based test split), and a gradient-boosted demand forecast backtested at 23.8% WAPE.
- Exported a Power BI star schema with a DAX rebuild guide, plus an interactive Plotly dashboard.

RAG LLM for Health Economics and Outcomes Research (HEOR) Analytics

Python, ChromaDB, Ollama, pytest (40 tests) | synthetic data github.com/Likhitab66/heor-rag-llm

- Built a RAG pipeline over 40 synthetic health-economics documents (fictional drugs) with ChromaDB retrieval, a TF-IDF fallback and an optional Llama 3 backend through Ollama, plus a demo mode that runs without a model.
- Wrote a grounding checker that scores how well the retrieved evidence supports each answer and flags any number not found in the sources: mean supportability of 0.977 on 25 gold answers, and 0.899 vs 0.322 on a hand-built grounded and hallucinated pair.

Predictive AI in Healthcare: FHIR Patient-Journey Analytics | Hackathon

Python, networkx, pytest (27 tests) | synthetic data github.com/Likhitab66/fhir-patient-journey-analytics

- Parsed synthetic patient records in the FHIR R4 standard (500 patients), mined treatment sequences and co-prescription patterns, and built a cohort-similarity therapy recommender prototype.
- Mapped HCP and HCO referral pathways as a weighted network graph (481 referrals, 3 communities) to find the main referral hubs.

EDUCATION

Master of Science, Data Science Jan 2023 to Mar 2024

New England College, Henniker, NH

Bachelor of Business Administration May 2018 to May 2021

GITAM University, India
